## Terminology for capacitive measurement

### Operating Principal

A capacitive proximity switch works with a high frequency oscillating circuit that creates an electromagnetic field on the active sensor surface by means of a capacitor. When a substantial or fluid substance nears this field a capacitance unbalance occurs and leads to a variation of the amplification in the oscillating circuit. If this amplification exceeds a threshold value, a switching signal is generated.

### Operating Distance

The operating distance is the separation of an object from the active sensor surface at which a switching signal is produced. The operating distance depends on the diameter of the sensor surface. Therefore larger sensors are required for longer operating distances. Many EGE sensors have an adjustable operating distance.

Capacitative proximity switches react to conductive materials and non-conductive materials with a dielectrical constant  $\epsilon > 1$ . The operating distance depends on the material. Constant measurement of different materials against earthed steel ST 37 yields a changed operating distance.

The following table lists the approximate values for the material dependent reduction factors. In practical applications there could be variations, because of the mounting conditions, for example.

Material	$\epsilon$	Operating distance in % (approx.)
Steel ST 37	Conductive	100
Saltwater	80	100
Marble	8	65
Porcelain	4-5	50
PE	2.3	10
Oil	2.2	10
Wood	2-7	10-60

The water content of an object or a liquid has a decisive influence on the operating distance. A high humidity content increases the operating distance considerably.

If the proximity switch is moistened with conductive materials, its function can be impaired when a conductive film builds up that electrically connects the sensor electrode with a metallic conducting side. Capacitive proximity switches can detect filling products right through non-electrically conducting container sides. The filler will certainly be detected if its dielectric constant is at least as large as that of the container sides.

### Rated operating distance $s_n$

The rated operating distance is a device parameter that does not take into account sample variances and external influences such as temperature and supply voltages.

### Effective operating distance $s_r$

The effective operating distance is the operating distance at nominal voltage and at nominal temperature of 23 °C. It is between 90% and 110% of the nominal switching distance.

### Usable operating distance $s_u$

The usable operating distance is in the entire allowable temperature and voltage range is between 80% and 120% of the real operating distance.

### Assured operating distance $s_a$

The assured operating distance takes into account all the external influences and sample variances and is in the range from 0% to 72% of the service usable distance. Within this range a guaranteed switching is ensured.

### Switch point drift

The operating distances are given for an ambient temperature of 23 °C. In the permissible temperature range the operating distance varies by less than 15 % from the value at 23 °C. The temperature of the measured object has no influence on the switch point.

### Hysteresis $H$

The switching hysteresis describes the distance between the turn on point while approaching an object and the turn off point during the separation of it from the sensor. The hysteresis brings about a stable switching signal even when there are vibrations, temperature drift, or electrical failures. The hysteresis is defined according to EN 60947-5-2 to be a maximum 20% from the real operating distance, and carries a value of typically 10% from the real operating distance  $s_r$  for EGE sensors.

### Repeating accuracy $R$

The repeating accuracy describes the maintenance of the switching point after the repeated approach of an object under specified circumstances. EGE sensors have typical tolerances of less than 3% of the real operating distance.

### Switching frequency

The maximum switching frequency of the sensor is determined at half nominal operating distance  $s_n$  with standard measurement plates ST 37 according to EN 60947-5-2.

## Terminology for capacitive measurement

### Supply voltage

The operating voltage is the voltage range in which EGE sensors function safely. For a constant voltage supply it is important to make sure that the limits are still observed when the residual ripple is included.

### Switching current

This current gives the maximum long-term current for the switching output of the sensor at an ambient temperature of 25 °C and ohmic load. At an elevated ambient temperature, the current load capability decreases.

For analog outputs, the boundary values given in the appropriate technical data, and particularly the permissible values for resistance loads, must be observed.

### Short circuit protection

The short circuit proof ensures the sensor against destruction through a short circuit on the output. After removal of the fault, the output is reactivated. Where a maximum overload current is listed, this should not be exceeded.

### Overcurrent release

This value indicates the median value of current at which the short circuit protection responds with a tolerance of  $\pm 20\%$ .

### Reverse polarity protection

The reverse polarity protection prevents destruction of the sensor by a reversal of the polarity of the voltage supply.

### Voltage drop $U_d$

The voltage drop arises at the internal resistance of semiconductor elements, which are in the current-path of the output. It is dependent of the load-current and is declared according to EN 60947-5-2 for a mean current of 50 mA.

### Residual current $I_r$

The residual current flows in the load current circuit when the output is blocked. The residual current must be considered when switching sensors in parallel.

### Minimum load current $I_m$

The minimum load current is necessary for flawless operation with two-wire devices.

### Current consumption

The current consumption is the maximum value of the no-load current  $I_0$  that the sensor can absorb without a load.

### Ambient temperature

The ambient temperature indicates the maximum allowable temperature range for the sensor.

### Electromagnetic compatibility EMC

The EMC class is a measure of the noise immunity of the sensor against external electrical and magnetic influences. The information is based on the standard EN 61000-6-2.

### Switch-on impulse suppression

EGE sensors have a switch-on impulse suppression that blocks the output during the switch-on phase, when the operational voltage is applied.

### Protection

The protective system indicates the protection of the sensors against penetration of foreign bodies and water according to EN 60529.

### LED-Display

EGE sensors with yellow light-emitting diodes indicate the switching status optically.

### Housing material

The housing material determines the chemical resistance of the sensor against external influences. For special applications, other housing materials are available.

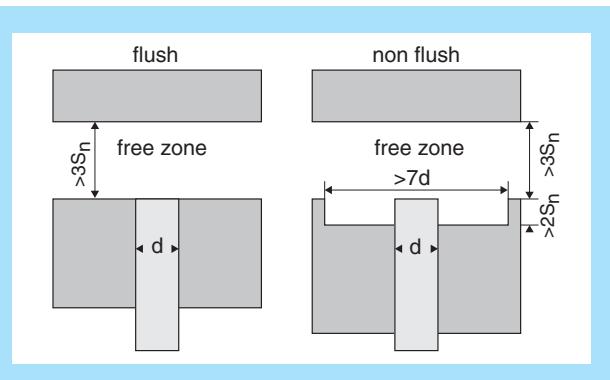

### Connection

The connection of the sensors is accomplished through plug-in connections or cables. Different cable types and lengths are available upon request.

## Instructions for mounting

### Mounting

For flush mounting the sensor can be built into metal up to its active surface without changing its characteristics. For non-flush mounting a metal-free zone around the sensor must be allowed for. A free zone to the material opposite the sensor must be maintained for all sensors.

The indicated free zones are in accordance with the standard EN 60947-5-2.

For mounting clamps see page 4.29.

## Terminology for capacitive measurement

### Collocation

When collocating the sensors, a minimum separation must be kept between the devices in order to avoid mutual influence. When in doubt, a test should be conducted under application conditions. For flush mounting the lateral separation between two sensors must correspond to at least the diameter of the sensor. For non flush mounting, the lateral separation from each other must correspond to at least twice the diameter of the sensor. For separations greater than eight times the diameter no mutual influence is to be expected. For oppositely mounted sensors, a minimal separation of eight times the nominal switching distance should be allowed.

### Torques

In order to prevent destruction of the threaded bushing during fitting, the following maximum torques must not be exceeded:

Design	Metal Housing	Plastic Housing
M12x1	10 Nm	1 Nm
M18x1	25 Nm	2 Nm
M30x1.5	40 Nm	5 Nm

PTFE sensors may only be tightened by hand.

### Instructions for operation

#### Serial connection

For the serial connection of two wire or three wire sensors the individual voltage drops are added together. Therefore there is a lesser operational voltage at the disposal of the load. The addition of the switch-on delay times should be noted.

#### Parallel connection

The parallel connection of two wire sensors can only be conditionally recommended since the residual currents are added together and flow through the load. For the parallel connection of three wire sensors, the current consumption of the individual devices is added together. Since this current does not flow through the load, the maximum number of parallel connectable three wire sensors depends only on the power supply.

### Approval for safety applications

Sensors for personal security must have a qualification approval according to EN 954-1 and must be labeled accordingly. Sensors that are not labeled must not be used for applications of this kind.

### Valid standards:

EN 60947-5-2

Control units; low voltage control units, auxiliary switch, proximity switch

EN 61000-6-4

Electromagnetic compatibility (EMC)

Interference emissions in the industrial area

EN 61000-6-2

Electromagnetic compatibility (EMC)

Generic standards immunity for industrial environments

EN 61000-4-2 (ESD)

Electrostatic discharging immunity

EN 61000-4-3 (HF radiated)

Radiated radio-frequency electromagnetic field immunity test

EN 61000-4-4 (Burst)

Electrical fast transient/burst immunity test

EN 60529

Protective systems, IP-designation

EN 60079-0 : 2012

Explosive atmospheres –

Part 0: Equipment – General requirements

EN 60079-11 : 2012

Explosive atmospheres –

Part 11: Equipment protection by intrinsic safety "i"

EN 60079-18 : 2009

Explosive atmospheres –

Part 18: Equipment protection by encapsulation "m"

### Authorisations

TÜV NORD CERT Zertifizierungsstelle - Deutschland  
(technical monitoring certification agency - Germany)

### Certification

TÜV NORD CERT ISO 9001

TÜV NORD CERT Quality control production  
Attachment IV of the EC-Guidelines  
94/9/EG

TÜV Nord Re-cancelling certificate according to  
EN 10204

PVC705SE	Z01123	PVC-transparent	9.2	7x0.5 mm <sup>2</sup> shielded	numbered cable, GN/YE

\*Tolerance of diameter ±0,4 mm

## A selection

### Flow sensors

- Electronical monitoring of flow
- Lubrication monitoring
- Measuring range 1 ml/min...100 l/min
- Detection range 1...300 cm/s
- Reaction time 0.5 s

### Level sensors

- For level monitoring -230...+230 °C
- Steam proof at a pressure of up to 30 bar
- For hot motor oil
- For liquid nitrogen
- For chemically aggressive media

### Ultrasonic

- Switching distance up to 5000 mm
- Level monitoring
- Watertight housing
- Teach-in functions

### Pressure sensors

- Compact model with digital display
- Monitoring in pipes and containers
- Pressure up to 16 bar
- Level up to 10 m ( $\pm 1$  cm)
- Programmable

### Temperature sensors

- Compact model with digital display
- Monitoring in pipes and containers
- Temperature -40...+120 °C ( $\pm 0,3$  °C)
- Pressure up to 100 bar
- Multi use output NO/NC + analog

### Infrared detectors

- Measurement of temperature
- Monitoring of hot media
- Position control
