### Kollmorgen Direct Drive Linear Motor Selection Guide

# Kollmorgen. Every solution comes from a real understanding of OEM challenges facing machine designers and users.

Escalating demands of the marketplace mean increased pressure on machine designers and users at every turn. Time constraints, demand for better performance, and consideration of next-generation machine technologies are just a few of the demands on today's machine designers and end users. While expectations are enormous, budgets are not. Kollmorgen's innovative automation solutions and broad range of quality motion products help engineers not only overcome these challenges but also build truly differentiated machines.

Because motion matters, it's our focus. Motion can distinctly differentiate a machine and deliver a marketplace advantage by improving its performance. This translates to overall increased efficiency on the factory floor. Perfectly deployed machine motion can make your customer's machine more reliable and efficient, enhance accuracy and improve operator safety. Motion also represents endless possibilities for innovation. We've always understood this potential, and thus, have kept motion at our core, relentlessly developing products that offer precision control of speed, accuracy and position in machines that rely on complex motion.

Because Motion Matters™

#### Removing the Barriers of Design, Sourcing, and Time

At Kollmorgen, we know that OEM engineers can achieve a lot more when obstacles aren't in the way. So, we clear obstacles in three important ways:

#### **Integrating Standard and Custom Products**

The optimal solution is often not clear-cut. Our application expertise allows us to modify standard products or develop totally custom solutions across our whole product portfolio so that designs can take flight.

#### **Providing Motion Solutions, Not Just Components**

As companies reduce their supplier base and have less engineering manpower, they need a total system supplier with a wide range of integrated solutions. Kollmorgen offers complete solutions as well as motion subsystems that combine programming software, engineering services and best-in-class motion components.

#### **Global Footprint**

With direct sales, engineering support, manufacturing facilities, and distributors across North America, Europe, and Asia, we're close to OEMs worldwide. Our proximity helps speed delivery and lend support where and when they're needed.

#### **Financial and Operational Stability**

Kollmorgen is part of Fortive. A key driver in the growth of all Fortive divisions is the Fortive Business System, which relies on the principle of "kaizen" – or continuous improvement. Using world-class tools, cross-disciplinary teams of exceptional people evaluate processes and develop plans that result in superior performance.

### **Direct Drive Linear Motor**

Our direct drive linear motor series provides new dimensions in performance with high throughput, accuracy, and zero maintenance. A linear motor is a frameless, permanent magnet, three phase, brushless servo motor. The product line consists of two fundamental constructions, Ironless (slotless) and Ironcore. Ironless motors have no attractive force between the framless components and zero cogging for ultra smooth motion. Ironcore motors provide the highest force per frame size and feature an anti-cogging design which yields extremely smooth operation.

#### The Benefits of Direct Drive Linear Motor

|   | Zero Maintenance   | with Greater | Accuracy and | d Higher F | landwidth |
|---|--------------------|--------------|--------------|------------|-----------|
| • | zero iviaintenance | with Greater | Accuracy and | u Hianer E | sanawiair |

- Smoother velocity and reduced audible noise
- Power transmission without backlash
- Transmission elements such as couplings, toothed belts, ball/lead screws, rack & pinions, and other fitted components can be eliminated
- No gears or screws, no lubrication required
- Improved machine reliability
- Wide Range of Sizes and Force to cover any Linear Application
- Increased performance for the entire system
- Flat, compact drive solution
- Easy mix and match motors and drives
- Real-life acceleration up to 10 G
- Simplified, High Force Permanent Magnet Design
- Higher bandwidth and faster response than ball/lead screws or rack & pinion solutions
- Rapid indexing of heavy loads with peak force up to 12700 N
- Fewer parts and lower cost of ownership
- More compact machine design
- No cogging and no attractive force (ironless motors)

**Ironless Motor** 

### Direct Drive Linear Motor Overview

#### **Kollmorgen Direct Drive Linear DDL Motor Series**

Kollmorgen supplied its first linear motors in the late 1970's for use in precision X-Y tables and coating systems. These were brush DC motors using the Kollmorgen patented push-through commutator bar method. This led to the 1980's development of the brushless versions of the linear motor which were used in film processing applications where smooth, high stiffness, linear motion was required. During the past 30 years, advances in permanent magnet material, power semiconductors, and microprocessor technology have been the enablers for increased performance and lower costs for linear motors.

DDL motors series ICH comply with the Low Voltage Directive 2014/35/EC for installation in a machine. Safety depends upon installing and configuring motor per the manufacturer's recommendations. The machine in which this product is to be installed must conform to the provisions of EC directive 2014/30/EC.

#### Standard Product Features

#### Ironcore:

- Peak force ICH series: 405 N to 12726 N
- Continuous force ICH series: 175 N to 5341 N
- Anti-cogging technique for minimal cogging without magnet skewing
- High motor constant (K\_m)
- · High force density
- Thermal protection PTC and KTY84-130
- Stainless steel magnet way covers
- Isolation system for 480 V AC

#### Ironless:

- Peak force 60 N to 1600 N
- Continuous force 21 N to 450 N
- Zero cogging
- Zero attractive force
- Smooth motion for speed as low as 1 micron/second
- Low mass coil assembly for high acceleration
- Isolation system for 230 V AC

#### **All Motors:**

- Zero contact, zero maintenance, brushless design
- 3 phase sinusoidal commutation
- Peak accelerations easily above 10 G
- High position accuracy and resolution
- Very low settling time
- Low thermal losses
- · Modular magnet design

#### **Standard Options:**

- · Hall effect feedback (digital)
- Thermal protection thermistor (PTC, ironless)
- Cable options

Our Direct Dirve Linear (DDL) motor series are frameless permanent magnet, three phase brushless servo motors. Fundamentally, a linear motor is a rotary motor that is rolled out flat.

The two primary components of permanent magnet brushless rotary motors are the stator (primary coils) and the rotor (secondary or rotating magnets). In brushless linear motors the rotor is rolled out flat to become the magnet track (also called the magnet way). The primary coils of the rotary motor are rolled out flat to become the coil assembly (also called the slider).

In most brushless linear motor applications it is typical for the magnet way to be stationary and the coil assembly to be in motion, because of the relative masses of the two components. It is also perfectly acceptable, and sometimes advantageous, to reverse this arrangement. The basic electromagnetic operating principles are the same in either case and are identical to those of a rotary motor.

**Rotary Motor Rolled Out Flat** 

#### **Direct Drive Linear Motor Options**

Two types of linear motors are available, Ironcore and Ironless. Each one provides characteristics and features that are optimal depending upon the application. Ironcore motors have coils wound on silicon steel laminations, to maximize the generated force, with a single sided magnet way.

Using an innovative electromagnetic design, DDL linear motors have the highest rated force per size, a high  $\rm K_m$  motor constant (equals low thermal losses), and low cogging forces without the need for skewing of the magnets. The high thrust forces possible with these motors make them ideal for accelerating and moving high masses, and

maintaining stiffness during machining or process forces. Ironless motors have no iron, or slots for the coils to be wound on. Therefore, these motors have zero cogging, a very light mass, and absolutely no attractive forces between the coil assembly and the magnet way. These characteristics are ideal for applications requiring very low bearing friction, high acceleration of lighter loads, and for maximizing constant velocity, even at ultra low speeds. The modular magnet ways consists of a double row of magnets to maximize the generated thrust force and to provide a flux return path for the magnetic circuit.

#### **Feedback Types**

All brushless motors require feedback for commutation. For a linear motor, commutation feedback can also be accomplished with a variety of methods. Digital or linear Hall effect devices are available from Kollmorgen for the DDL motor series which allow the drive electronics to commutate the linear motors in a manner identical to rotary motors.

For exceptionally smooth motion requirements, sinusoidal drive electronics using digital Hall effects, provide sinusoidal drive currents to the motor for the best constant force and velocity performance.

As an alternative, it is typical for linear motor applications to have a linear encoder present in the system for position feedback. It is increasingly common today for drive amplifiers to derive the necessary commutation information directly from this linear encoder, either with or without supplemental digital Hall effect devices on startup.

### Direct Drive Linear Motor Overview

#### **Advantages**

#### **Wide Speed Range**

Since the frameless parts of the linear motor are non-contact, and no limitations of a mechanical transmission are present, both very high speeds and very low speeds are easily obtainable. Speeds are truly not limited by the motor. Instead, by eliminating the mechanical transmission, speed becomes limited by other elements in the system such as the linear bearings, and the achievable bandwidth from any feedback devices. Application speeds of greater than 5 meters per second or less than 1 micron per second are typically achievable. In comparison, mechanical transmissions such as ball screws are commonly limited to linear speeds of 0.5 to 0.7 meters per second because of resonances and wear. In addition to a wide speed range, linear motors, both ironcore and ironless, have excellent constant velocity characteristics, typically better than ±0.01% speed variation.

#### **High System Dynamics**

In addition to high speed capability, direct drive linear motors are capable of very high accelerations. Limited only by the system bearings, accelerations of 3 to 5 G are quite typical for the larger motors and accelerations exceeding 10 G are easily achievable for smaller motors.

#### **Easy Selection process:**

- Determine peak and continuous force required for your applications (see our applications section on pages 38-41)
- 2. Use the motor selection guide on pages 8-9 to choose your motor
- 3. Refer to the appropriate pages in the data publication for technical details
- 4. Build model number for ordering using pages 42 44

#### **Smooth Operation and Positional Accuracy**

Both ironless and ironcore motors exhibit very smooth motion profiles due to the inherent motor design of Kollmorgen's DDL series.

Cogging, which is a component of force, is greatly reduced in the ironcore designs and is zero in the ironless designs. As a result, these direct drive linear motors provide very low force and velocity ripple for ultra smooth motion. Positioning accuracies are limited only by the feedback resolution, and sub-micron resolutions are commonly achievable.

#### **Unlimited Travel**

With the DDL motor series, magnet ways are made in 4 modular sections: 64 mm, 128 mm, 256 mm and 512 mm long. Each module can be added in unlimited numbers to any other module to allow for unlimited travel. Whether the travel required is 1mm or 100 meters the DDL series can accommodate the need.

#### No Wear or Maintenance

Linear motors have few components, therefore the need for ball screw components such as nuts, bearing blocks, couplings, motor mounts and the need to maintain these components have been eliminated. Very long life and clean operation, with no lubrication or maintenance of these parts are the result.

#### **Integration of Components is Much Simpler**

Frameless linear motors require much fewer components than rotary motors with mechanical transmissions. A 0.9 mm airgap for the ironcore design and 0.5 mm airgap for the ironless design is the only alignment of the frameless linear motor components that is necessary. No critical alignments are required as with ball screws. Straightness of travel as provided by the system linear bearings is more than suffi-cient for the Kollmorgen linear motors.

#### **Typical Applications for Linear Motors Include:**

Machine Tool
Drilling
Milling

Grinding
Laser cutting

Cam grinding Semiconductor

Wafer handling process Wafer-inspection

Wafer slicing Tab bonding

Wire bonding lon implantation

Lithography Textile

Carpet tufting Plasma cutting

Polishing

Preform injection (plastics)

Patient table
Handling systems

Measurement/Inspection Coordinate measurement

machines

Electronic assembly Pick-and-place machines Component insertion Screen printers Adhesive dispensers

PC-board inspection. drilling

Other applications include:

Flight Simulators Acceleration sleds

Catapult

G-Force measurement

#### Notes:

- The motor continuous force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.

  Alternate windings are available on request. Please consult the Kollmorgen Customer Support for design options.

  Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.
- Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations. Winding phase connection: A1: Y (star) windings, A5:  $\Delta$  (triangle) windings

# ICH11 Outline Drawings

#### **Ironcore Motors Series**

| Motor Coil | Coil Width      | Motor Height   | <b>Hole Grid Spacing</b> |
|------------|-----------------|----------------|--------------------------|
| Туре       | A (mm)          | B (mm)         | C (mm)                   |
| ICH11-030  | 60.0±1.0        | 58.6±0.1       | 16.0                     |
| ICH11-050  | $80.0 \pm 1.0$  | $58.6 \pm 0.1$ | 36.0                     |
| ICH11-075  | 105.0 ± 1.0     | $58.6 \pm 0.1$ | 32.0                     |
| ICH11-100  | 130.0 ± 1.0     | $58.6 \pm 0.1$ | 36.0                     |
| ICH11-150  | 180.0 ± 1.0     | $60.6 \pm 0.1$ | 32.0                     |
| ICH11-200  | $230.0 \pm 1.0$ | $60.6 \pm 0.1$ | 36.0                     |
| ICH11-250  | 280.0 ± 1.0     | 62.6±0.1       | 32.0                     |

Resultant airgap = 0.9 mm nominal (0.5 mm minimum) when components are set up to dimension "B" in table above. Number of holes and typical installation of mulitple ironcore magnet assemblies: please refer to page 21

#### **Cable Option Flying Leads**

| Leads | Cable Length (mm) |
|-------|-------------------|
| C1    | 400               |
| C2    | 200               |
| C3    | 100               |
| C4    | 1200              |

#### Cable Option Connector on the Cable (Only available for Motors with $\rm I_{c} < 15\,A)$

Pin side view (mating view)

Extension with pins: BKUA-MR24-42-0035-000

Suggested mating connector BSTA-108-FR05-08-0036-000 (cable mounted) or BDFA-108-FR05-00-0150-000 (flange mounted)

| Connector | Cable Length (mm) |
|-----------|-------------------|
| P1        | 400               |
| P2        | 200               |
| P3        | 100               |
| P4        | 1200              |

Shield is connected to motor core and connectors case

#### **Cable Types**

#### Notes:

- 1. The motor continuous force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.
- 2. Alternate windings are available on request. Please consult the Kollmorgen Customer Support for design options.
- 3. Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.
- 4. Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.
- 5. Winding phase connection: A1: Y (star) windings, A5: Δ (triangle) windings

# ICH22 Outline Drawings

#### **Ironcore Motors Series**

MOTOR-WAY ASSEMBLY ICH22-XXX

| Motor Coil | Coil Width      | Motor Height   | Hole Grid Spacing |  |  |  |
|------------|-----------------|----------------|-------------------|--|--|--|
| Туре       | A (mm)          | B (mm)         | C (mm)            |  |  |  |
| ICH22-030  | 60.0±1.0        | 58.6±0.1       | 16.0              |  |  |  |
| ICH22-050  | $80.0 \pm 1.0$  | $58.6 \pm 0.1$ | 36.0              |  |  |  |
| ICH22-075  | 105.0 ± 1.0     | 58.6 ± 0.1     | 32.0              |  |  |  |
| ICH22-100  | 130.0 ± 1.0     | $58.6 \pm 0.1$ | 36.0              |  |  |  |
| ICH22-150  | 180.0 ± 1.0     | 60.6 ± 0.1     | 32.0              |  |  |  |
| ICH22-200  | $230.0 \pm 1.0$ | $60.6 \pm 0.1$ | 36.0              |  |  |  |
| ICH22-250  | 280.0 ± 1.0     | 62.6±0.1       | 32.0              |  |  |  |

Resultant airgap = 0.9 mm nominal (0.5 mm minimum) when components are set up to dimension "B" in table above. Number of holes and typical installation of mulitple ironcore magnet assemblies: please refer to page 21

#### **Cable Option Flying Leads**

| Leads | Cable Length (mm) |
|-------|-------------------|
| C1    | 400               |
| C2    | 200               |
| C3    | 100               |
| C4    | 1200              |

#### Cable Option Connector on the Cable (Only available for Motors with $I_{\rm c}$ < 15 A)

(mating view)

Extension with pins: BKUA-MR24-42-0035-000

Suggested mating connector BSTA-108-FR05-08-0036-000 (cable mounted) or BDFA-108-FR05-00-0150-000 (flange mounted)

| Connector | Cable Length (mm) |
|-----------|-------------------|
| P1        | 400               |
| P2        | 200               |
| P3        | 100               |
| P4        | 1200              |

Shield is connected to motor core and connectors case

#### Notes:

- The motor continuous force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.

  Alternate windings are available on request. Please consult the Kollmorgen Customer Support for design options.

  Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier
- etc. must be considered to determine the achievable acceleration in each application.

  Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.

  Winding phase connection: A1: Y (star) windings, A5: Δ (triangle) windings

#### Notes:

- 1. The motor continuous force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.
- 2. Alternate windings are available on request. Please consult the Kollmorgen Customer Support for design options.
- 3. Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.
- 4. Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.
- Winding phase connection: A1: Y (star) windings, A5: Δ (triangle) windings

# ICH44 Outline Drawings

#### **Ironcore Motors Series**

MOTOR-WAY ASSEMBLY ICH44-XXX

| Motor Coil | Coil Width      | Motor Height   | <b>Hole Grid Spacing</b> |
|------------|-----------------|----------------|--------------------------|
| Туре       | A (mm)          | B (mm)         | C (mm)                   |
| ICH44-030  | $60.0 \pm 1.0$  | 58.6±0.1       | 16.0                     |
| ICH44-050  | $80.0 \pm 1.0$  | $58.6 \pm 0.1$ | 36.0                     |
| ICH44-075  | 105.0 ± 1.0     | 58.6±0.1       | 32.0                     |
| ICH44-100  | $130.0 \pm 1.0$ | $58.6 \pm 0.1$ | 36.0                     |
| ICH44-150  | 180.0±1.0       | 60.6±0.1       | 32.0                     |
| ICH44-200  | $230.0 \pm 1.0$ | $60.6 \pm 0.1$ | 36.0                     |
| ICH44-250  | $280.0 \pm 1.0$ | 62.6±0.1       | 32.0                     |

Resultant airgap = 0.9 mm nominal (0.5 mm minimum) when components are set up to dimension "B" in table above. Number of holes and typical installation of mulitple ironcore magnet assemblies: please refer to page 21

#### **Cable Option Flying Leads**

| Leads | Cable Length (mm) |
|-------|-------------------|
| C1    | 400               |
| C2    | 200               |
| C3    | 100               |
| C4    | 1200              |

#### Cable Option Connector on the Cable (Only available for Motors with $I_{\rm s} < 15\,{\rm A}$ )

Extension with pins: BKUA-MR24-42-0035-000

Suggested mating connector BSTA-108-FR05-08-0036-000 (cable mounted) or BDFA-108-FR05-00-0150-000 (flange mounted)

| Connector | Cable Length (mm) |
|-----------|-------------------|
| P1        | 400               |
| P2        | 200               |
| P3        | 100               |
| P4        | 1200              |

Shield is connected to motor core and connectors case

#### **Typical Installation of Multiple Ironcore Magnet Assemblies**

Magnet Way widths correspond to the mating coil assembly width. Magnet Way assemblies are modular and come in standard lengths: 64, 128, 256, 512 mm. Multiple magnet assemblies can be installed to obtain the desired length. Shown below is the method to mount multiple assemblies.

#### **Typical Mounting Bar Lengths & Mounting Holes Tabulation**

#### Notes:

- 1. The motor continuous rated force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.
- 2. Alternate windings can be made available. Please consult the Kollmorgen Customer Support for design options.

4. Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.

<sup>3.</sup> Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.

- The motor continuous rated force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.

  Alternate windings can be made available. Please consult the Kollmorgen Customer Support for design options.

  Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.

  Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.

#### Notes:

The motor continuous rated force is measured with the motor coils achieving the motor maximum allowable temperature Tmax.

Alternate windings can be made available. Please consult the Kollmorgen Customer Support for design options.

Maximum theoretical acceleration is based on the motors peak force and the motor mass alone. Limitations due to such factors as the additional mass of the load, the bearing type and design, the shock rating of the feedback, the peak current available from the amplifier etc. must be considered to determine the achievable acceleration in each application.

Please see our application sizing pages in the back of this guide for more details on sizing and thermal considerations.

# Ironless Magnet Ways

Magnet Way widths correspond to the mating coil assembly width.

Magnet Way assemblies are modular and come in standard lengths: 64. 128. 256. 512 mm.

#### **Bottom Mounting Installation**

Dimensions in mm

#### **Side mounting installation**

#### **Ironcore and Ironless Motors Output Diagrams**

Magnet pole pitch:

Both Ironcore (ICH) and Ironless (IL) feature the same pole pitch. which is 32 mm (360 electrical degrees).

Motor BEMF phases U, V, W relative to Hall effect devices S1,S2,S3 with coil travel direction towards the motor output cable assembly exit as shown on the right hand side

#### Note:

1. The diagram above refers to both ironless (IL) and ironcore (ICH) motors

#### **Mounting of Hall Sensor on ICH Ironcore Motors**

#### Hall Sensor Mounting Distance X

| ІСН Туре | X (mm) | Y (mm) |
|----------|--------|--------|
| ICH11    | 34.9   | 25.1   |
| ICH22    | 48.9   | 38.1   |
| ICH33    | 60.9   | 51.1   |
| ICH44    | 36.4   | 26.6   |

#### Dimensions Hall Sensor HD-Y-Px or HD-D-Px (mm)

## **Application Sizing**

#### To size a Linear Motor, you will need to:

- 1. Define a Move Profile
- 2. Define the Load
- 3. Size the Motor and the Amplifier

From the move profile, we can calculate the maximum speed and the maximum acceleration/deceleration. From the load we can calculate all of the forces at constant speed and using the move profile all the dynamic forces during acceleration and deceleration. Once a motor is selected, the weight of the moving parts of the motor are added to the moving weight to calculate a total Peak Force and a total RMS force. The motor should be able to deliver the peak force and the calculated RMS force should be less than the motor continuous force to ensure a known safety margin. The coil temperature rise can also be calculated to ensure that it is lower than the intended maximum temperature rise.

The maximum bus voltage and continuous and peak current can also be calculated and compared to the selected amplifier to be sure the calculated performances can be achieved.

#### 1. Move Profile

#### Triangular/Trapezoidal

|   | SI        |
| $\mathrm{S}_{\mathrm{m}}$ - Move displacement | meters    |
| t <sub>a</sub> - Acceleration Time            | seconds   |
| t <sub>r</sub> - Time run at constant speed   | seconds   |
| t <sub>d</sub> - Deceleration Time            | seconds   |
| t <sub>dw</sub> - Dwell Time                  | seconds   |
| V <sub>m</sub> - Max Velocity                 | meter     |
| A <sub>m</sub> - Acceleration                 | meter/sec |
| D <sub>m</sub> - Deceleration                 | meter/sec |

#### **Example:**

Move 0.1 meter in 100 msec assuming  $t_a = t_d$  and  $t_r = 0$ . (assume triangular move)

Max Speed:  $V_m = 2 \cdot S_m \ / \ (\ t_a + t_d + 2 \cdot t_r \ )$   $V_m = 2 \cdot 0.1 \ / \ (\ 100E-3 \ ) \ m/s$ 

#### **Max Acceleration/Deceleration**

Acceleration 
$$A_{m} = V_{m}/t_{a}$$
 
$$A_{m} = 2/50E-3 \text{ m/s2}$$
 
$$= 40 \text{ m/s2}$$
 
$$A_{m} "g" = A_{m}/9.81 \text{ m/s2}$$
 
$$a (g) = 40/9.81$$
 
$$= 4.08 \text{ g}$$
 
$$Deceleration \qquad D_{m} = V_{m}/t_{d}$$
 
$$D_{m} = 2/50E-3 \text{ m/s2}$$
 
$$= 40 \text{ m/s2}$$
 
$$Dm "g" = Dm/9.81 \text{ m/s2}$$
 
$$d(g) = 40/9.81$$

= 4.08 g

| M <sub>cb</sub> - Counterbalance Mass        | kg       |
| F <sub>a</sub> - Magnetic Attraction Force   | N        |
| CB - Counterbalance of load in %             | _        |
| q - Angle of Linear Displacement             |          |
| with horizontal                              |          |
| (0°= horizontal, 90° vertical)               | degrees  |
| g - Gravity coefficient                      | 9.81 m/s |
| n - Number of motors in parallel             | _        |

#### **BASIC FORMULAS\*:**

We assume a general case where we have n motors solidly coupled pushing the load and a possible counterbalance weight Mcb (Mostly for vertical displacement).

#### Example of Coefficient of Friction µ:

| Linear bearing w/ balls   | 0.002 - 0.004 |
|---------------------------|---------------|
| Linear bearing w/ rollers | 0.005         |
| Steel on oiled steel      | 0.06          |
| Steel on dry steel        | 0.2           |
| Steel on concrete         | 0.3           |

#### **Counterbalance Weight:**

 $M_{ch} = MI \cdot CB/100$ 

#### **Acceleration Force only:**

Facc =  $[(M_1/n) \cdot (1 + CB/100) + M_c] \cdot Am$ 

#### Run Force at constant speed:

$$F_r = (M_1/n + M_c) \cdot g \cdot SIN(q) + m \cdot cos(q) - (Mcb/n) \cdot g + F_a \cdot \mu + F_{ext}/n$$

#### **Deceleration Force only:**

$$F_{dec} = [(M_1/n) \cdot (1 + CB/100) + M_c] \cdot D_m$$

#### **Maximum Acceleration Force:**

$$F_{am} = F_{acc} + F_{r}$$

#### **Maximum Deceleration Force:**

$$F_{dm} = F_{dec} - F_r$$

#### **Dwell Force:**

$$F_{dw} = (M_1 / n + M_c) \cdot g \cdot [\sin(q)] - (M_{ch} / n) \cdot g$$

RMS Force:

$$F_{rms} = \sqrt{\frac{F_{am}^2 \cdot t_a + F_r^2 \cdot t_r + F_{dm}^2 \cdot t_d + F_{dw}^2 \cdot t_{dw}}{t_a + t_r + t_d + t_{dw}}}$$

#### 3. SIZE THE MOTOR AND AMPLIFIER

#### Example:

| Moving Weight:        | MI = 0.5  kg  |
|-----------------------|---------------|
| Number of Motors:     | n = 1         |
| Horizontal Move:      | q = 0         |
| Counterbalance Force: | $M_{cb} = 0$  |
| External Force:       | $F_{ext} = 0$ |
| Friction Coefficient: | m = 0.01      |

Assume same move as above with a Dwell Time of 50 ms.

Run Force at Constant Speed:  $F_c = 0.5 \cdot 9.81 \cdot 0.01 = 0.05 \text{ N}$ 

Rms Force:

$$F_{rms} = \sqrt{\frac{(20.05)^2 \cdot (50E-3) + (19.95)^2 \cdot (50E-3)}{100E-3 + 50E-3}}$$

$$F_{rms} = 16.3 \text{ N}$$

#### **Motor Sizing:**

If we select an ironless motor for smoothest possible move we can use Motor IL060-30A1. This motor has a coil mass of 0.21 kg and no attractive force. By adding that weight in equations above, we need an additional force of  $0.21 \cdot 40 \cdot 0.01 = 0.084$  N. So peak force is 20.05 + 0.08 = 28.45 N and RMS force is 23.19 N. This motor will have a safety factor of  $(38-23.19)\cdot 100/38 = 39\%$ .

| Sizing the Amplifier :                       | SI Units                |
|--|-------------------------|
| I <sub>a</sub> - Max Acceleration Current    | А                       |
| I <sub>r</sub> - Run Current                 | А                       |
| I <sub>d</sub> - Max Deceleration Current    | А                       |
| I <sub>dw</sub> - Dwell Current              | А                       |
| I <sub>rms</sub> - RMS Current               | А                       |
| K <sub>f</sub> - Force Constant              | N/A                     |
| R <sub>m</sub> - Motor Electrical Resistance | Ohms L-L                |
| K <sub>e</sub> - Back EMF Constant           | Vpeak/m/s               |
| V <sub>bus</sub> - Bus Voltage               | V DC                    |
| L - Electrical Inductance                    | H L-L                   |
| Max Acceleration Current:                    | $I_a = F_{am}/K_f$      |
| Run Current at constant Speed:               | $I_r = F_r / K_f$       |
| Max Deceleration Current only:               | $I_d = F_{dm}/K_f$      |
| Dwell Current:                               | $I_{dw} = F_{dw}/K_f$   |
| RMS Current:                                 | $I_{rms} = F_{rms}/K_f$ |

<sup>\*</sup> All calculations are given in SI units

### **Application Sizing**

#### **BUS VOLTAGE:**

If we assume a sine wave drive with a phase advance  $\phi$  (degrees) and full conduction, the minimum bus voltage (see Fig. 1) is:

$$\begin{split} &V_{b1} = 2.4 \, V \\ &V_{b2} = K_e \cdot V_m \\ &V_{b3} = \frac{\sqrt{3}}{\sqrt{2}} \cdot R_{m.hot} \cdot I_{rms} \\ &V_{b4} = 2\pi \frac{\sqrt{3}}{\sqrt{2}} \cdot L \cdot I_{rms} \cdot V_m / Pitch \\ &a_v = arctan \, (V_{b4} / V_{b3}) \\ &V_{Ir} = \sqrt{V_{b3}^2 + V_{b4}^2} \\ &V_{bre} = V_{b2} + V_{Ir} \cdot cos \, (a_v + \phi) \\ &V_{bim} = V_{Ir} \cdot sin \, (a_v + \phi) \\ &V_{bus} = V_{b1} + \sqrt{V_{bre}^2 + V_{bim}^2} \end{split}$$

Note: If there is no phase advance take  $\varphi = 0^{\circ}$ 

Figure 1:

#### THERMAL CONSIDERATIONS:

|   | Units<br><b>SI</b> |  |  |
|---|--------------------|--|--|
| $\Delta 	heta$ - Coil increase of temperature | °C                 |  |  |
| R <sub>th</sub> - Thermal Resistance          | °C/W               |  |  |
| K <sub>m</sub> - Motor Constant               | N/ √W              |  |  |
| P <sub>out</sub> - Output Power               | W                  |  |  |

#### **Coil Temperature rise**

$$\Delta\theta = R_{th} \cdot (F_{rms}/K_m)^2$$

#### Resistance of Coil hot (copper)

$$R_{m,hot} = \frac{R_{ambient} (234.5 + \theta_{hot})}{(234.5 + \theta_{amb})}$$

#### **Power Losses**

$$P_{lrms} = \Delta\theta / R_{th} = \frac{(\theta_{hot} - \theta_{ambient})}{R_{th}}$$

#### **Output Power**

$$P_{out (max)} = F_{am} \cdot V_{m}$$

#### **Example: In above example with:**

$$R_{th} = 1.61 \, ^{\circ}\text{C/W}$$
  
 $K_m = 4.7 \, \text{N/} \, \sqrt{\text{W}}$ 

#### **Coil Temperature rise:**

 $\Delta\theta = 1.61 \cdot (23.19/4.7)^2 = 39.2^{\circ}C$  Power losses P<sub>1</sub> = 39.2 / 1.61 = 24.34 Watts Max output Power P<sub>out (max)</sub> = 57 Watts

#### The Use of the Motor Constant K:

Cognizance of the heat load being generated by the linear motor is an important consideration in the application of any linear motor. Linear motors are direct drive devices, typically mounted very close to the moving load. Therefore, any heat generated by the linear motor needs to be managed to avoid affecting the process or workpiece that the moving load is carrying. The motor constant  $K_{\rm m}$  is a powerful parameter that can be used to determine this heat load,  $K_{\rm m}$  equals:

$$K_m = \frac{F}{\sqrt{P_c}}$$
 where the RMS force F is in Newtons, the RMS heat load Pc is in Watts and  $K_m$  is in units of N  $/\sqrt{W}$ 

40 K O L L M O R G E N

The motor constant,  $K_m$ , allows us to determine motor performance capabilities such as shown in the following two examples. In the first example, we use  $K_m$  to calculate, for a given force, how many watts of generated heat are dissipated by the motoris coil assembly. In the second, we use  $K_m$  to determine the maximum RMS force developed by the motor when the dissipated power is limited to some value.

1. An application requires a continuous thrust force of 200 Newtons. The ICH11-050 ironcore motor is a good candidate, having a continuous force rating of 299 Newtons and a  $K_m$  of 38.0 N/ $\sqrt{W}$ . Therefore, since resistance rises 1.452 times at 145°C from the ambient value at 25°C, and since resistance is the square root denominator of  $K_m$ , we must write our equation as follows:

$$Force = \frac{K_m}{\sqrt{Factor}} \sqrt{Power (dissipated)}$$

$$200 = \frac{38.0}{\sqrt{1.452}} \sqrt{\text{Watts}}$$

Power (dissipated) = 40.2 Watts

This value of watts is the power or heat generated by the motor.

2. The same application requires that no more than 20 watts are to be dissipated by the motor into the surrounding structure and environment. What is the maximum RMS force that the ICH11-050 motor may produce while not exceeding this power limit?

Maximum RMS Force = 
$$\frac{38.0}{\sqrt{1.452}}$$
  $\sqrt{20}$  = 141 N

Therefore, if the motor delivers no more than 141 N of thrust force on an RMS basis, then this same motor will not dissipate more than 20 watts.

#### **Continuous Force Fc as a Function of Ambient Temperature**

In our data sheets the continuous rated force Fc is the RMS force that the motor can supply continuously 100% of the time, assuming the ambient temperature is 25°C and with the coils achieving a maximum temperature of 130°C (IL series motors) respectively 145°C (ICH series motors). At higher or lower ambient temperatures, the  $\rm F_c$  of the motor must be adjusted by a factor that is determined by the following equation:

Factor = 
$$\sqrt{\frac{(130 - \theta_{Amb})}{105}}$$
 (for IL series motors)

Factor = 
$$\sqrt{\frac{(145 - \theta_{Amb})}{120}}$$
 (for ICH series motors where  $\theta_{Amb}$  = Ambient Temperature in °C

#### This factor vs. ambient temperature works out as:

#### **ICH Ironcore Linear Motors**

| 5°C   | 10°C  | 15°C  | 20°C  | 25°C  | 30°C  | 35°C  | 40°C  | 45°C  |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 1 080 | 1 061 | 1 041 | 1 021 | 1 000 | N 979 | N 957 | N 935 | N 913 |

#### **IL Ironless Linear Motors**

| 5°C   | 10°C  | 15°C  | 20°C  | 25°C  | 30°C  | 35°C  | 40°C  | 45°C  |
